Summary

Discussion covered Clappy AI stability challenges and introduced Brand OS methodology for knowledge management and development.

Addressing Clappy AI Instability

Pipeline issues arose from recent model updates. The decision was made to revert the project to version 4.6 to ensure ongoing stability.

Brand OS Methodology

The team introduced an LLM wiki system to act as a centralized, persistent knowledge base for projects. This structure logs decisions and tracks rationale across all project documentation.

Project Strategy and Accessibility

Development will prioritize Brand OS as a shippable product with managed client services. Future demonstrations will utilize fake brands to simplify complex product features for non-technical users.

Rate this Summary: [Helpful](#) or [Not Helpful](#)

Decisions

ALIGNED

- **Project software version constrained to 4.6** The project development version is set to 4.6 to resolve pipeline stability issues.
- **Sales presentation strategy includes fake brand** The team will utilize a fake brand demo case in sales presentations to effectively demonstrate the platform's utility to prospective clients.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

Next steps

- ☐ [The Dude] Restore project stability: Revert to version 4.6 to ensure the system is working properly.
- ☐ [The Dude] Finalize quotes: Evaluate video output logs and determine the pricing values.
- ☐ [Justin Lobaito] Demonstrate Brand OS: Show technical processes and project management tools during a deep dive session with The Dude.
- ☐ [Justin Lobaito] Process meeting data: Upload the current transcript into the raw directory for ingestion.
- ☐ [Justin Lobaito] Develop presentation assets: Build a set of sample brand materials to use for future client demonstrations.
- ☐ [The group] Coordinate team meeting: Schedule a time for all members to connect after June 3rd.
- ☐ [Justin Lobaito] Forward Access Details: Forward the calendar link for the session scheduled next week.
- ☐ [Justin Lobaito] Update Guest List: Add participant to the calendar event for the weekend.
- ☐ [The Dude] Fix Bison: Address the low hanging fruit in the code.
- ☐ [The Dude] Ping Collaborator: Notify partner at 4:00 regarding status or readiness.

Details

- **Pipeline Issues and Clappy AI Status:** The Dude reported experiencing significant pipeline issues while working with Clappy AI, which they attributed to the recent switch to the latest Claude model version. They observed the model acting like ChatGPT, offering repetitive and ineffective solutions ([00:00:00](#)). The consensus reached was that the project, currently stable, requires The Dude to review video output logs and judge the quotes ([00:01:05](#)). To resolve the pipeline instability, The Dude plans to revert the project to version 4.6 and ensure stability from that point forward ([00:00:00](#)).
- **Brand OS Development:** Justin Lobaito introduced "Brand OS," a platform they are building that functions as a brand's operating system ([00:02:01](#)). The project includes a functional roadmap and utilizes a GitHub structure for planning development phases. Justin noted that Claude Opus 4.8 was released yesterday and highlighted the importance of avoiding the 4.7 version due to performance concerns ([00:03:01](#)).
- **LLM Wiki Methodology:** Justin Lobaito detailed a new methodology referred to as an "LLM wiki," which acts as a centralized knowledge base for projects. This system ingests emails, meeting notes—such as the current session—and other project documentation to create a "company bible" ([00:04:57](#)). This wiki grows and changes in real-time, allowing users to query information about past decisions, timelines, and project directions ([00:06:04](#)).
- **Project Management Integration:** The wiki system functions by parsing raw folders of information and creating a "spiderweb of knowledge" ([00:08:04](#)). Justin Lobaito explained that this system currently helps them manage day-to-day tasks, such as drafting emails by scraping their inbox based on current client lists. The goal is to provide a high-level view of project status while tracking active decisions and maintaining a clear paper trail ([00:09:13](#)).
- **Home Link Project Case Study:** To demonstrate the methodology, Justin Lobaito showcased the "Home Link" project, a massive website initiative ([00:13:02](#)). Justin fed the wiki project proposals, competitive analyses, and transcripts from UX workshops, allowing them to query the system for specific project details, such as research competitors or client feedback ([00:14:03](#)).
- **Documentation and Decision Tracking:** Justin Lobaito emphasized that the wiki never deletes information; instead, it logs new decisions, noting when previous decisions have been superseded ([00:16:26](#)). When Justin makes a decision—such as switching a database structure—the system automatically logs the rationale and the context of the change ([00:17:19](#)). This process ensures that a persistent paper trail is maintained,

regardless of which model (e.g., Claude 4.6, 4.8, or Sonnet) is used to perform the tasks ([00:18:23](#)).

- **Addressing Model Instability:** The Dude expressed concerns about how "stealth changes" in AI models might disrupt projects or alter the output style ([00:19:26](#)) ([00:23:25](#)). Justin Lobaito argued that by maintaining rigorous documentation and building a structured environment, the models can be controlled more effectively, as the documentation serves as the "source of truth" for the model to reference ([00:21:20](#)) ([00:23:25](#)).
- **Tool Accessibility and Target User:** The participants discussed the complexity of the Brand OS tool. The Dude questioned whether someone without high-level technical expertise could effectively use the system without blaming the product for failures ([00:26:29](#)). Justin Lobaito clarified that while they are developing the process, the ultimate goal is to provide a service where they set up the system for clients, rather than requiring the client to act as a "power user" ([00:24:30](#)).
- **Client-Facing Flexibility:** Alexandra Chacon asked if the system could support temporary marketing campaigns, such as a Memorial Day sale, without requiring a permanent reset of the project data ([00:29:24](#)). Justin Lobaito confirmed that because the system uses "branching," users can create new marketing campaigns while remaining grounded in the original brand knowledge, allowing for future replication or updates of successful strategies ([00:31:14](#)).
- **Project Roadmap Comparison:** The Dude suggested that Justin Lobaito's Brand OS appears more robust and closer to a shippable product than Clappy AI ([00:33:14](#)). Justin Lobaito confirmed that they are moving forward with Brand OS, including the development of a dealer portal and AI-driven marketing material generation ([00:35:05](#)). The Dude expressed interest in potentially integrating the Brand OS logic into Clappy AI's development ([00:34:12](#)).
- **Client Presentation Strategy:** Alexandra Chacon advised that for future client presentations, Justin Lobaito should create a "fake brand" demo. This would allow prospective clients to see a step-by-step walkthrough of how the product functions, rather than relying on complex code displays that may confuse non-technical users ([00:37:36](#)).
- **Future Scheduling:** The Dude and Justin Lobaito agreed to hold a technical "nerd out" session to discuss the development details further ([00:36:40](#)) ([00:39:22](#)). They planned to meet early the following day, tentatively aiming for 4:00 AM, to accommodate The Dude's 7:00 AM schedule constraints ([00:40:02](#)). Alexandra Chacon requested to be included in the invitation to listen if available ([00:39:22](#)).

Touch base - Transcript

00:00:00

The Dude: So, um, and then Clappy I is on me before I got back to

Alexandra Chacon: Okay.

The Dude: it. There were some major major major pipeline issues that started to stack and I noticed it and it was probably the worst two days with cloud coding and I didn't realize what had happened was the switch over to the latest claw. It started doing a lot of the s***

Alexandra Chacon: Ah,

The Dude: that chat GBT does where it keeps telling you this is the solution.

Alexandra Chacon: people pleasing.

The Dude: Let's go down this road and then evidently it's just like 30 attempts to fix the edit and I'm like no we need to f*** stop.

Alexandra Chacon: Is that a problem that you see is going to keep

The Dude: No, the solution is and I should have known it then, but this is perspective is to just go back to the version that was working and I do have access is

Alexandra Chacon: happening?

The Dude: 4.6 and then load the project up and make sure that it's stable and then just go from there.

Justin Lobaito: What?

00:01:05

The Dude: So, the project is stable right now. It is waiting on me to look at the output logs of the video and then just uh judge the quotes. They were very close when I left off, but then that's when like the first time I ended up in the hospital and then work started taking a s*** and I was like, I can't deal with this all right now.

Alexandra Chacon: Yeah,

The Dude: So that's on me. What else you need status for

Alexandra Chacon: that's it. I mean,

The Dude: me?

Alexandra Chacon: I think those are the two that's the two most major, you know, where are we with these two things?

The Dude: Um, Justin's been going to town, so I we connected a couple times so I know you've been like progressing

Justin Lobaito: Huh?

The Dude: on your stuff.

Alexandra Chacon: Yeah, give us some info. Save our

The Dude: Oh, I can tell you the agency like I had scheduled an appointment for 30 minutes with

Alexandra Chacon: day.

The Dude: them and then they moved it to 15 minutes and I was like this is a complete waste.

00:02:01

The Dude: They don't understand. They don't understand this present. This is like getting present presented to them.

Alexandra Chacon: Yeah.

The Dude: Like they kept going down this road of we need to solve m*****. I've just like given you two options to expedite what you guys are doing without playing this little f***** we got the building blocks. We can do this ourselves. You didn't take it. You're never gonna take it. No, I canceled the

Justin Lobaito: That's fine. Um, I mean, in full transparency, like I'm starting to introduce a bunch of the concepts that So,

The Dude: meeting.

Justin Lobaito: yeah, I'm introducing a bunch of the concepts that I'm that's really kicked the ceiling off of the stuff that I'm able to do kind of like in a broader sense and I'm starting to explore around the idea of um, not just the brand OS, which is what I started to call the platform that I'm building, um your brand's operating system. So, I've got an actual function. I've got an actual road map right now.

00:03:01

Justin Lobaito: Now, I just linked a GitHub thing for you that's been phenomenal

The Dude: I saw

Justin Lobaito: as far as like properly planning like development phases and and then having having Claude manage sub agents to do the task that then run the planning's done on like 4.8 or 4.6. Don't use 4.7. It's trash. Um, but Opus 4.8 was just released yesterday.

The Dude: I saw that. I didn't know what um Yeah,

Justin Lobaito: So,

The Dude: I didn't know what had changed. I just haven't had a chance, but I did see the 420 came out.

Justin Lobaito: yep. Yep. So,

The Dude: Will you have time to show me this a little bit?

Justin Lobaito: yeah. Yeah,

The Dude: Okay.

Justin Lobaito: I will certainly have time.

The Dude: I need a I I need a nerd deep dive so

Justin Lobaito: But I mean, and that's where I'm gonna start to head right now is this really nerdy stuff here.

The Dude: bad.

Justin Lobaito: So, um, this this is not necessarily quite the app that I'm going to talk about here, but it does kind of play into it.

00:03:58

Justin Lobaito: Uh, on the app side of things, Brand OS, um, I've actually got a pretty

Alexandra Chacon: I love that name, by the way.

Justin Lobaito: robust.

Alexandra Chacon: That's a great name. The great that's a great name, Brando.

Justin Lobaito: Thank you. Yeah. So, I've got kind of like positioning stuff for it here that is just sticking around. But channel platform for manufacturers, distributors, and dealers, the inventory,

The Dude: Yeah.

Justin Lobaito: the ideas, and what this this this was this is a road map that I built probably three or four weeks ago when I thought I was going to go to North Carolina to kind of pitch the idea to a manufacturer. That then allowed me that I the there's a personal investment I have to do with that that I feel like wasn't worth it at the time. And so, but that allowed me to kind of take a step back and really flush flush this out a bit. In conjunction doing that, I've been taking on a like massive rethinking about how AI plays a factor in just like day-to-day tasks, project management.

00:04:57

Justin Lobaito: And I think I mentioned it a while ago just in a text message or I forget where it was just the the concept of a of an LLM wiki. And so that's what I've been kind of starting to integrate and that's where so basically what it is is um a centralized data source for all your projects a knowledge base for all your projects you feed it. So inside the the brand OS directory here it's this data

The Dude: Can you go full screen with that?

Justin Lobaito: folder and what's that

The Dude: I'm sorry. It's I'm struggling. Can you go full screen,

Justin Lobaito: uh I will try

The Dude: brother? Press one of the buttons. It's a green one. Is it not?

Justin Lobaito: yeah no uh actually this might be a better one here. Okay I'm going to do this project here. So I've started to do this on now all my projects including on things for Two Rivers which is my day job and starting to pitch this concept to kind of like company higher level company and is kind of know what you're talking about with your agency having somebody who can kind of consult and come in and talk about this stuff.

00:06:04

The Dude: What?

Justin Lobaito: So this pro I mean don't don't worry about the actual website. The the really cool thing about this is this whole docs directory here. And so what I've what I've built and it's not it's not even it's not even something I've built. It's more of a process and methodology is every single project gets loaded with this wiki structure and I created some skills of it. Give the wiki a brief to get started and then dump in. Right now I have Claude scraping my inbox for specific uh you know emails that are tied to the project and it's going to grab it's gonna grab all those emails. It's going to grab all of the Gemini notes that we have meetings like this and it's going to ingest all that and it's going to start to build this wiki that is just the centralized knowledge base for everything that the project needs to know.

The Dude: What is this called in a general like company bible? Is that what it's called?

Justin Lobaito: So,

The Dude: Is this is this is not the same thing or like am I because there's obviously there's um style guides, right?

00:07:12

The Dude: Or then there's like there's a bigger thing called that. I'm just asking because I think it's like a

Alexandra Chacon: It would be a company Bible is what you'd call it,

The Dude: company

Justin Lobaito: yep.

Alexandra Chacon: but this is it seems like it's more than that because it's like it's a company Bible that is it's like a it's like growing and changing, right? Because you can update in in real time.

Justin Lobaito: Yes, that's so the whole point

Alexandra Chacon: You know what I mean?

The Dude: Just trying to like connect

Alexandra Chacon: Yeah. Yeah.

Justin Lobaito: of this then is that any kind of person in their discipline especially in an

The Dude: that.

Alexandra Chacon: Yeah.

Justin Lobaito: agency structure can now query against this knowledge base and it's going to house information you could be a project manager and hey when was XYZ determined And so it's kind of cool. It takes you have this raw folder here. You can dump anything and everything inside of it. And it just starts to parse all that information.

00:08:04

Justin Lobaito: Like this one's not a very robust project, but it parses that information, starts to determine things that are decisions, things that are just overall domain knowledge, and it starts to seed and populate your wiki. And then what's great about it is is that it then cross references to the other files that it just creates a spiderweb of knowledge and content so that it can always find the paper trail of when decisions were made, timestamped, when when things when things pivoted, what the overall direction is, what the creative brief is, everything. And what I'm starting to play around with is is then taking this back and I've started to incorporate this now at

The Dude: Can you pause one second? I'm sorry.

Justin Lobaito: um

The Dude: I need to make sure you're awake. Okay. Thank you. That was

Justin Lobaito: so then I've started up just to take this concept then on an overall just knowledge

The Dude: it.

Justin Lobaito: database for me and this now feed this handles all of the business requirements and all the business information and then it sends information down to the project wikis which the project wiks then send information back up to it.

00:09:13

Justin Lobaito: So everything kind of has this overall just awareness of everything that's kind of going on and that's the biggest thing I've been geeking out over the last probably month or so.

The Dude: Can I ask you? I see that this is scraping information everywhere.

Justin Lobaito: Yep.

The Dude: Are you thinking that this also feeds information or is it not a a source of knowledge for other applications or you wouldn't ever make independent of

Justin Lobaito: Oh, so right now this right right now this is think of it as as this view right
The Dude: this

Justin Lobaito: here that you're looking at. This is the mile high my project manager, right? I can go into I can go into a project and start to from here figure out where things are at. But then when I'm on a project, projects have their own wiki. So this is feeding information to themselves from the from the um kind like overall project manager down to the projects and then back and forth. But then also this drafts emails for me. It it runs a it runs a um runs a process here to give me, hey, wherever I'm at right now, just scrape scrape my inbox based off of the this current client project list and and tell me the things I need to reply to.

00:10:30

Justin Lobaito: Give me a bucket list of give me a quick hit of things I need to reply to, things that are that I've left running. and it creates this. I've already ran so I don't need to do it right now, but it creates this. Here's like here's the things I haven't addressed today. Uh this will formulate a response or I can also just create the draft and then go into my own Gmail account and send it send the send the email. But if I go deeper into so here's like the client level, here's project level, it it decide it keeps track of all your active decisions. And right now this isn't live syncing. I have to run a sync for these projects. But that's kind of my next step. But for a very high level, this has been I'm starting to see like the value in just looking at creating applications for businesses and whether it's solving a business problem like at a very very high level, easy one. This thing solves just people like me who who run small shops that like they they need to try and keep up with communication.

00:11:38

Justin Lobaito: That's what this thing is doing.

The Dude: Okay.

Justin Lobaito: The brand OS is turning into like, well, how can I now create these mid-tier distributors and manufacturers a centralized source to manage their channel marketing platform? Um, so that's kind of where I'm taking things. There's a I here I'm going to switch computers here real quick. So, one second. Actually, I'll just log in. One second. There's going to be two of us here. One. So I'm starting to play around with this model of just and that's what my that that's why freelance business has always done well is solving business problems and not just like selling websites websites I mean especially nowadays anybody can do a website but looking at selling hearing the hearing the business problems and then now creating because the ceiling is just now gone off of what our ability is that we can do now we can create these really really fine-tuned applications per the specific business problems. I'm going

to mute myself on this computer real quick. Actually, I'm going to mute this

00:13:02

Alexandra Chacon: So at its core,

Justin Lobaito: one.

Alexandra Chacon: this is a um like it's a marketing it's a it it suggests marketing strategy for you, right? It's a Yeah,

Justin Lobaito: Yep.

Alexandra Chacon: you can take everything and kind of just throw it all the spaghetti at the wall and then it goes, "Okay, this is this is what we can

Justin Lobaito: Yep. So, here's one that I've done on I'm going to share screens on this other computer here.

Alexandra Chacon: do.

Justin Lobaito: This is a Two Rivers project. This is where I really started to play around with the idea of creating the knowledge base for other people to use. Um, so home link, we have this project here called Home Link. I'm going to share my screen real quick. Screen. Okay. So, we have a project here called um with a one of our sister companies called Home Link. I really don't know what they do. They have something that involves insurance. Uh, and I'm I was kind of brought into the project as like the UX uh UI person.

00:14:03

Justin Lobaito: We had a very specific person who was doing um a bunch of the research into it. So, this project is a full it's a it's a full massive website project that has a lot of intricacies with it and a lot of just domain knowledge that is not in a typical vocabulary. We had we did uh you know we have the the proposal in so I I fed this project I've been feeding this project for about a month now the proposal the com the and this is all our own doing our own research the competitive analysis the specific um the specific um current state of home link and where they want to be taking. So it was a it was a s*** ton of of documentation that I fed the wiki that now at any point I can query it to do to ask it kind of anything that I needed to do. So this documentation we had a we had a massive UX workshop with home link. I fed it the Gemini recording. I fed it kind of our digital mood our digital not mood board but uh our digital kind of like sketchboard that we were working with on the the client who was remote.

00:15:13

Justin Lobaito: And now there's now this is just like a massive starting point that is really that is really really really well well built out that I can start to query this thing against anything like what are some of the competitors we um we did research on. So now because all these things are connected and kind of going back to the other example over here if I've created a knowledge base that knows everything about me and knows knows a high level about my projects and I have a very specific project knowledge bases that my capacity for being able to maintain information and now I can start to create now I can start to query this thing against like future paths and future directions and hey start doing your own research based upon our starting coin and that's

The Dude: So that I was about to touch on two questions there. I'm assuming you're still prompting those, but the goal is to um have it automatically do it.

Justin Lobaito: Yep.

The Dude: How do you cop how do you stop it from overriding information and prioritizing what the most current information is?

00:16:26

Justin Lobaito: So it it it never deletes. It always it always either marks something as So if let's say there's a let's say there's so there's directories in here that are called decisions. uh here's all the decisions that have been made on the project um you know and it just keeps this constant log. So this decision was on what what platform it's going to be built on. This is a um not using um I I forget what these ones are specifically, but anyways, so if decisions ever get updated, it gets logged in the wiki that this decision has been superseded by another decision and it links back to that decision.

The Dude: So, it's just logging,

Justin Lobaito: So you can always What's

The Dude: but then it's up to the user.

Justin Lobaito: that?

The Dude: It's just logging it, but it's up to the user to make sure that it made the right choice. That That's what I'm I feel like

Justin Lobaito: Well, so this is so this is where I'm starting to I'll get in with you about geeking

00:17:19

The Dude: there.

Justin Lobaito: out back on the brand OS side of things.

The Dude: Okay.

Justin Lobaito: I've created this this this same structure. I've created the get s*** done plugin that I just I just I just uh linked to you. I have automatic like hey this this is the things that that the wiki should be doing. And that's kind of in here. So in your cloud MD, you're starting off with um what decisions should be captured inside the wiki just kind of automatically. So every time that I make a that I'm in a chat session with Claude and I say, "Hey, like just recently I switched the database structure for the brand OS to be a different one." And it just automatically logged all those decisions. it it logged the the kind of the um it logged kind of the the decision tree that it took to get there. So like here here's all our context and that's what I'm kind of all over the place because I'm kind of excited about all this. That's the biggest thing is not the models.

00:18:23

Justin Lobaito: It's not 5 point chat GPD 5.5 or or opus 4.8. It's the context and creating structures in place so that the context is always captured. You can jump between whatever model you want to. And so there are models that like 4.8 I'm experiment experimenting with right now, but I've been using 4.6. I stopped using 4.7. But that are really good at planning. But once the plan is super solid and concrete, you can have sonnet or something do the code. So that's what this orchestrates. This orchestrates all of that. Just, hey, look here for these things when I'm when I'm making these decisions. Log it here and make sure there's always a paper trail. That's the biggest thing about it. There's always a paper trail. I can just dump. So like after this meeting, I'm going to I'm I'm going to dump I have a folder for us. I'm going to dump this Gemini transcript into this um into the uh into the raw directory for that project.

00:19:26

Justin Lobaito: And I'm going to say, "All right, ingest everything that the everything that I just put in there." You can put in you can put in a text document that has a bunch of links that you that you happen to like. You can put in a PDF and it'll read the PDF and it'll disseminate the information that's important to you based upon kind of how you've started this project. And it just keeps growing and keeps understanding as you as you grow and understand with what you want to accomplish.

The Dude: I have a question before I forget it. If you're good for it, um, how do you protect? Look at these engines. They shift. They shift f***** drastically.

Justin Lobaito: Yep.

The Dude: You shift an engine here. Is everything else that's been built protected or are you running the risk of Cloud 4.8 a

Justin Lobaito: Yep.

The Dude: deciding to adjust everything you're doing into the style that it does. The reason I'm asking you is because of what happened with the application that I was working on with Clappy.

00:20:19

Justin Lobaito: Yep.

The Dude: The stealth changes f*****

Justin Lobaito: So th this kind of comes down into the process.

The Dude: me.

Justin Lobaito: So when I'm when I'm so brand OS it would be the most equivalent thing to like your clappy. I'm creating a fullfledged massive application that I have that I used all this to plan a road map against. I'm now executing upon each phase of the road map and we're making decisions along the way. We're we're pivoting, changing course, all those kinds of things. It's all in the planning. And so some of these tools like the get s*** done, there's another one that I'll send you now. It's called Grill Me that that's how I that's how I start to seed the wiki is I run a a grill me session. And all that does is that that rigorously like probes you and questioning about like you know when you say this like have you thought through this kind of thing. And the whole point is to create a shared understanding across you and the model.

00:21:20

Justin Lobaito: And then where I've taken that now is then that shared understanding then gets to be like the the the creative brief that that seeds the wiki and writes all the rules for how the wiki should operate. Then from there once you have your just centralized knowledge source just kind of seated then you can start to populate and start to feed it and start to plan against it. So

The Dude: I guess from my standpoint is like what I've already experienced is when I

Justin Lobaito: integrating.

The Dude: have an environment let's just I mean this is your basically like your your environment which is for information when the ground is constantly or the environment is constantly shifting that leads to your results or your

Justin Lobaito: Yep.

The Dude: outputs shifting.

Justin Lobaito: Yep.

The Dude: How does not like as as it being an active learning environment, how do you maintain its output? Does that make

Justin Lobaito: Yep. Yep. So,

The Dude: sense?

Justin Lobaito: I think and I think this kind of like answers that because this is so well documented, the models don't deviate.

00:22:24

The Dude: Okay.

Justin Lobaito: Unless there's a bad model like 4.7 was just bad, right?

The Dude: Yeah.

Justin Lobaito: 4.7 was just bad when it came to like doing code, but like 4.6 wasn't. So, you can write rules inside this like, "Hey, plan against me." Like when we're planning something, let's use 4.8 or 4.7, but we're writing code because the documentation is so good at this point. Jump down to a lower model.

The Dude: Okay.

Justin Lobaito: It saves your It saves your session usage. It saves your And so yeah,

The Dude: Oh, they don't let you have access to that model.

Justin Lobaito: they do. I mean, until they don't, but um right now I haven't ran into the problems that you have,

The Dude: Okay.

Justin Lobaito: and I've done some serious.

The Dude: I I mean I'm asking from the perspective of what I've run across is I'm always I'm trying to make sure that I guess whatever the product is is that like it lives in its

Justin Lobaito: Yeah.

The Dude: constant state because if you think of traditional applications when the application shifts or shifts the version that the client is using they can always roll back to a stable version but if the version that they're using is

00:23:25

Justin Lobaito: Yep. Yep.

The Dude: constantly changing f*** that sounds dangerous to me. You can't guarantee that the product will work the same way that it did yesterday or at 6 a.m.

Justin Lobaito: and that's where the documentation becomes the most important thing at this

The Dude: Does the client have to worry about that?

Justin Lobaito: point.

The Dude: Nobody want to maintain pro.

Justin Lobaito: Um,

The Dude: Is this thing's acting funny? Let me go check the documentation. I'm not trying to be funny,

Justin Lobaito: yep.

The Dude: but I'm just saying like you'll check it.

Justin Lobaito: Yeah.

The Dude: I'll check it.

Justin Lobaito: Yep.

The Dude: Most people you send them informations as short as possible and then they will probably skip it and click a

Justin Lobaito: Well, this documentation like this is all the these are all of

The Dude: link.

Justin Lobaito: the decision points and like everything that is documented for brand OS. This isn't for my purposes. This is for the model so that when I start to plan for the next phase or when I start to um when I start to like start thinking through features, I have a solid ground to start

00:24:30

The Dude: for you currently.

Justin Lobaito: from

The Dude: What happens if when this gets white labelled for somebody else's use?

Justin Lobaito: the method.

The Dude: You understand like you

Justin Lobaito: So the practice so the the practice is the same.

The Dude: don't

Justin Lobaito: I think I think that and that's what I'm refining and that's what I'm then that's why I brought something like this to two rivers. I don't want to bring things to them but like hey I need more examples to practice this methodology on and start to bring in other people to start to use it in ways that they may know and they may

The Dude: My the thing that I'm catching and maybe I'm missing it.

Justin Lobaito: utilize.

The Dude: It feels like the only people who will be able to understand this is somebody who has intricate knowledge like you do.

Justin Lobaito: I I think where this comes into play is somebody like me setting this up for somebody so that then it can run and ingest knowledge for that person that I don't need to be a part of that.

00:25:27

The Dude: Justin, you're not a dumb guy. Your level of like knowledge and expertise is not common. So, you're assuming you're assuming that there's other people that can do

Justin Lobaito: So like so the end result of all of this is and this is what I'm starting

The Dude: this.

Justin Lobaito: to play around with is kind of back to that dashboard that I have that is like hey here's my project manager that also knows all about my projects is installing dashboard type things for clients or creating hosted dashboard type things for clients to

The Dude: So,

Justin Lobaito: either a run a task about like

The Dude: are people that you employ and that you can educate or is it people that you're selling this product to and hoping they can keep it

Alexandra Chacon: I think the point would be that you're dancing around Nell is the the end

The Dude: going?

Alexandra Chacon: goal for this product. Is it to be able to go to a company that's like a Fortune 500 company that has an IT department and has people working that can troubleshoot if necessary and and help set this up?

00:26:29

Alexandra Chacon: Or is this for like a small business that's expanding and and franchising, you know, and opening up different locations and and like that mid-level like I think originally we were talking about this being marketed towards like a mid-level business, right? Not like the Fortune 500, not Amazon, right? But also not like Dooy Films

Justin Lobaito: Yep.

The Dude: So I feel like knows where I'm headed with this and I guess where I'm heading with this is exactly what she just

Alexandra Chacon: being

The Dude: explained. If to me it feels like the level of user that needs to control is definitely high, right? But the people that say that they can, I don't know about you, but IP it levels when of people sometimes you get somebody who really knows their s*** and you get somebody who's really faking it. So if that person is faking it is using their your product, they are not going to take ownership of it not working, they're going to blame you that it's a s***** product. You see what I'm saying?

Justin Lobaito: Yep.

00:27:21

The Dude: Are you giving are you giving somebody who really doesn't reach the standard of a power user the ability to ship on your product and then their position sometimes it's like the person that speaks the loudest looks like the professional like the one that's that knows it and they become such a source of like everybody leans on this guy says

Alexandra Chacon: that. Plus, anybody that's on your level of thinking about it is going to look at it and if there's anything that doesn't

Justin Lobaito: Hey,

Alexandra Chacon: work exactly the way they want it, they're just going to go, "Oh, I can build this and I can do it the way I

The Dude: I know it's a lot of variables,

Justin Lobaito: heat.

The Dude: but I I I I'm coming from a position that I've seen especially

Alexandra Chacon: want

The Dude: it a lot of folks are smoking mirrors with a lot of respect in what they say because you're an IT professional.

Justin Lobaito: Yep.

The Dude: So, if that person does have that power and they go run a f***** YouTube takedown on your s***** product when your product isn't s*****, what happens?

00:28:13

The Dude: Am I think overthinking this too much? But I I'm just looking at a product

Justin Lobaito: So,

The Dude: positioning

Justin Lobaito: here's here's where I think that where I think we're we're all kind of saying something similar and talking about something similar,

The Dude: there. I'm not verbalizing it

Justin Lobaito: but we're actually we're actually deviating is this is

The Dude: all.

Justin Lobaito: a process that has helped me out immensely in planning and I don't think this is the product. What this allows to do is to start thinking through what are products like if this

The Dude: Okay.

Justin Lobaito: type of like if this type of just process here and and that's kind of what my uncovering was is that I created a methodology and a process that has been like instant help for me and now help for the agency that I work

The Dude: So this is a development tool for you not a client facing or even pro

Justin Lobaito: at.

The Dude: tool. Is that what I'm understanding?

Justin Lobaito: I think I think the I think the the areas of application for something like this are what like how do we incorporate this into things like products and that's kind of the underlying quote unquote software behind things.

00:29:24

The Dude: Okay.

Justin Lobaito: Yep.

Alexandra Chacon: Hey, I have to jump because Zoe's at the the bus stop,

The Dude: Okay.

Alexandra Chacon: but I just had one really quick question for you.

Justin Lobaito: So

Alexandra Chacon: If when when this is a client-f facing um application, what happens if the client um let's say that they put something into the system or they were running a promotion that's like a short-term promotion?

Justin Lobaito: heat.

Alexandra Chacon: Is there like a almost like a toggle where they can toggle that information on and and take it off at will and go back like revert to what they what they had before or if it does something that they don't like and they want to go back to what they had before. Is there that option? Are we are we considering putting that option into it? Does that make sense?

Justin Lobaito: Yeah. Yeah.

Alexandra Chacon: My question

Justin Lobaito: So, um in in terms of like just like a hard reset, that's not what the purpose of this is because that even that decision should be logged. But because everything is logged,

00:30:18

Alexandra Chacon: Okay.

Justin Lobaito: going resetting back to something should be or is accessible.

Alexandra Chacon: So, like like for example, Memorial Day was just like Memorial Day sales and all that stuff. Like, so let's say you're you're you've marketed this and you've got it working in some place that's selling furniture and it's franchised and it's kind of all over the place and it's working for their brand and whatnot. And now they're they need to come up with a marketing strategy to gear toward build up to this Memorial Day sale that they're having. They put in all this information that's driven towards like the Memorial Day sale vibe, but now Memorial Day is over.

Justin Lobaito: Yep.

Alexandra Chacon: They want to just go back to not a hard reset to the very beginning of of time with their situation,

Justin Lobaito: Yep.

Alexandra Chacon: but they just want to go back a few

Justin Lobaito: That would be like that that would be like so like this thing is not this thing is not accomplishing the one specific

Alexandra Chacon: months.

Justin Lobaito: thing. This thing is having knowledge about everything that you want to do.

00:31:14

Justin Lobaito: So it would be a decision point like hey here's my brand. Here's my everything you know about me. I want to start to run a marketing campaign. That's a new branch that's coming off.

Alexandra Chacon: Got it.

Justin Lobaito: I want this marketing campaign to be revolved around Memorial Day. Check check my HubSpot and see what has been what has been effective in the last

Alexandra Chacon: Cool.

Justin Lobaito: year or so on the on promotions we've done. That's a decision point. The the root of the tree is always still grounded. A new branch just just just emerges with all the context of everything you've done before.

Alexandra Chacon: And what if you want to ride down that same branch again? Like if what we did Memorial Day this year really worked well and I loved it and we want to do the same thing but updated

Justin Lobaito: Yep.

Alexandra Chacon: for 2027, can I just go in and say, "Okay, give me this same campaign. I want to do the same thing, but I just want to have all my material updated for 2027." Is that possible?

00:32:08

Justin Lobaito: Yep. Yeah. And so because and and that's the whole purpose of it is that you don't need to be specific.

Alexandra Chacon: Cool.

Justin Lobaito: you. This is now just like a massive research hub that research and knowledge hub that I can just say like, hey, we switched the database structure. Why did we do that? And everything that like when I when I ran through those hours of like switching database structure is now logged in all those back and forth, all those conversations. In the case of the Memorial

Day sale, that is a branch that now you can query against like, okay, this worked back in 2025, going up there for 2026. Let me know if if we start connecting other apps to it that are also feeding information like Google Analytics, like um you know, any one of their tracking softwares. We start say, "Hey, let me know what worked. If if we if we drove to multiple landing pages, which ones are the most effective? let's go let's let's let's focus on just those two and really tweak the messaging.

00:33:14

Justin Lobaito: That's kind of the long-term like what the use of this is is to really be the thought partner that people say AI should

Alexandra Chacon: Yeah. Okay,

The Dude: real quick question because I got to jump off too, but while everybody's here,

Justin Lobaito: be

Alexandra Chacon: cool.

The Dude: uh, you don't have to answer it now, but just think about it. I feel like you're way closer to a real product than I can get Clappy ready to ship. Think about that. Let me know what you if you agree with that.

Alexandra Chacon: What it sounds to me like the lineup is right now is backup bison brand OS clappy.

The Dude: That's what it's feeling like to me to be honest because this feels way more

Alexandra Chacon: Yeah.

Justin Lobaito: Yeah.

The Dude: robust than where I'm at with Clappy and it's like do we put energy to this? Do I like how can I help you here before I go down the pipeline with I mean I can keep copy going but I feel like I feel like the read I'm getting is that this is way closer but

00:34:12

Justin Lobaito: So just before I hop off, so at some point I made decision point back in uh May 7th.

The Dude: that's

Justin Lobaito: Um good question. The rationale for this is documented. Let me pull it from the canonical decision record. So I gave you the actual reasoning, not a paraphrase of it. And that's now that is why this is the rules and the harness on this are so well documented and that as this feeds it writes its own rules and harnesses so that it keeps the same structure and keeps the same. But here's the reasons why I switched the whole database structure so I can always come back and reference

The Dude: You're giving me so much f***** better notes than I have.

Justin Lobaito: things.

The Dude: And honestly, when I see this, I'm just like, it's almost like if I get a better understanding of it, is it worth deploying this into Clappy's development? Because so much of like the logic that I'm building off of lives right here.

Justin Lobaito: Yep. You need to unload it.

00:35:05

The Dude: And I'm having to remember what I did when I have to go

Justin Lobaito: And so so kind of back to I'm sorry you guys have time.

The Dude: back. Go ahead. I'm

Justin Lobaito: Um kind of back to your question like what is a closer product?

The Dude: sorry.

Justin Lobaito: I brand OS is moving forward. I have a demonstration of like actual dealer portal component of it's not just site builders anymore. Now it's going to handle the whole dealer portal that I've already built inside of a a craft CMS instance. So that from there I can take it to I can take it to like the next features of that which would be like using AI to create marketing materials for the dealers that are already on it. Creating a pricing model for that. What I'm also closer to doing is being able to talk through these type of things with clients much better than I was and give concrete examples than I was, you know, a month ago. Is demonstrating real life or

The Dude: I almost want to like sit in on watching you present.

00:35:58

Justin Lobaito: real

The Dude: And the reason I say it is I see people gloss over when they're trying to follow what I'm explaining because it's way higher level.

Justin Lobaito: Yep.

The Dude: You're so much higher level than what I present and I'm struggling to follow. So, I'm just gonna mention that.

Justin Lobaito: I get what I'll be honest. I'm very technical with you guys,

The Dude: Okay.

Justin Lobaito: but I I do do very well in front of clients.

The Dude: I I don't I'm just being technical and that's a weird that's I swear you don't want me in front of a client.

Justin Lobaito: Yeah.

The Dude: So that that's the thing.

Justin Lobaito: Yeah.

The Dude: I haven't seen you present to a client, but I'm like if this is how you're presenting, dude, like if I look at the code and I read it and I understand it,

Justin Lobaito: No.

The Dude: but like following what you're telling me, I'm like, "Oh my goodness." I I know where you're going with some of the stuff,

Justin Lobaito: Yeah. No.

The Dude: but like you see where the questions are like

00:36:40

Justin Lobaito: Like presentations for clients are not hey here's what the code's doing. Presentations are the visual layer of like hey now this thing this is brand this is the wiki just visualize now and I can start to say like you know inside this project it's going to load up everything that knows from the project wiki and I can start to ask it questions inside of a UI and it's going to it's going to build the the pie in the sky wiki as well as the project wiki as well too.

The Dude: Okay, pause for a second because we're all going to have to hop off and let Alex.

Justin Lobaito: Yep.

The Dude: I think you and I would benefit from doing a nerd out over the weekend so we don't like bore

Justin Lobaito: Yep.

The Dude: the f*** out of Alex. But I think that we need to all three get back on when everybody has time.

Justin Lobaito: Yep.

Alexandra Chacon: I I free up starting uh June 1st, second, and third is when my project is actually happening. So theoretically, if my s*** isn't done by then, then I'm f*****.

00:37:36

Alexandra Chacon: So, I'm good. By the the first I should be totally free and and available. Um, which is basically next week. Um, I one just note before I really really have to go. Um, if you're when you're presenting this to people, my suggestion just as being the layman on the call is you should put together a a fake brand,

Justin Lobaito: Yep.

Alexandra Chacon: like have the assets for a fake brand so that you can walk them through the step by step and they can see exactly how they would how they could utilize this.

The Dude: to be honest. Do you have to do a freak fake brand or private

Alexandra Chacon: And

The Dude: pitch? Just saying. And it people used to do spec and it was fine as long as it's not public because that's a lot of information to

Alexandra Chacon: Yeah.

The Dude: generate for a sample ding company.

Justin Lobaito: Yep.

The Dude: That's That's

Alexandra Chacon: Well, if you're going to wash, rinse,

The Dude: awesome.

Alexandra Chacon: and repeat and you're going to sell it to multiple different companies, putting that together and just walking through like it's a like a demonstration.

00:38:39

Alexandra Chacon: You know, if you were going to sell a product that cleans up stains off of a clo off of clothes, you would have your your clothes. You would dump the wine on it. You would do the whole, you know, like here's dog s*** rubbed in it and here's wine and here's grass stains and let me show you how it comes out and how amazing my product is. So, if you like, again, me as the layman on the call because I don't understand the code of it. Like I, you know, I know what coding is and all of that, but I don't understand when I'm looking at the the actual numbers and letters that are there. It's beautiful and and you guys get it. But me, if I were the client and you were trying to sell it to me, I would Yeah. I would want to see it, see how it works.

The Dude: Power.

Justin Lobaito: Yep.

Alexandra Chacon: Yeah.

The Dude: That makes

Alexandra Chacon: Yeah. All right.

The Dude: sense.

Alexandra Chacon: I got to jump.

00:39:22

Alexandra Chacon: I got to go get Zoe. Um, send me an invite for if you guys are want to get together next week.

Justin Lobaito: Yep.

Alexandra Chacon: I'm around. And if you want, just include me in the invite for this weekend. If I can jump on, I will. and and just listen to you guys nerd out that.

Justin Lobaito: Sure.

The Dude: Yeah,

Alexandra Chacon: All

The Dude: I'm gonna I'm gonna tackle the the low hanging fruit is f*****

Alexandra Chacon: right.

The Dude: fixed bison. So, I'm not going to do it today. Spend time with the baby and and the trip, but um probably tomorrow. So, um Justin, when you got time for me, I'll make time. So,

Justin Lobaito: Are you um now like I kind of have to be up early tomorrow to uh smoke a pork butt for a party we're having. I mean, I'll be up before everybody else gets up in the house. I don't know how early you get up on

The Dude: Um,

Justin Lobaito: weekend.

00:40:02

The Dude: let me ask Trisha because I think she works tomorrow. So, I might be up early.

Justin Lobaito: Okay. Like what what time is up for

The Dude: Hey, baby. Do you work tomorrow?

Justin Lobaito: you?

The Dude: Yeah. Do you work tomorrow? What time? So, what time do you need me up? So, she would need me up at 7. I could probably get up earlier than that. What time you need me? You need me up?

Justin Lobaito: I mean, if you're up, you want to get up at 600, you can

The Dude: Let's shoot for that.

Justin Lobaito: just

The Dude: And then if I for some reason, I mean, I have to be up at 7. Like,

Justin Lobaito: Yeah. Yep.

The Dude: there's no getting around.

Justin Lobaito: I gotta be I gotta be up at 4 to get the thing in on the smoker in time. So,

The Dude: If I'm up earlier, I'll ping you around four if that's cool. Like,

Justin Lobaito: yeah. Yeah.

The Dude: okay.

Justin Lobaito: What do you mean?

The Dude: Okay, man. See you.

Justin Lobaito: That's you.

The Dude: Hey.
